

Lithos

Mr. Le Chevillier, Sales Manager, Lithos

Lithos, a 100 % subsidiary of the company Elvia PCB, specializes in the manufacturing of high technology printed circuits for the electronic industry, and more specifically for ultra high frequency applications.

We have been in this business for 18 years. At that time we were a little in advance compared to the market, but nowadays this field is in full development. Thanks to our advance we are now leader on the French market in the area of ultra high frequency.

We were among the first and loyal exhibitors of the trade show RF&Hyper which represents for us a venue where we can meet people wishing to develop their equipments and to exchange views on the various problems encountered (materials, feasibility, definition, component integration, etc. ...).

We are comprehensive sub-contractors, and we work in partnership with our customers on many developments in house. Technicians come to us for advice before starting their projects. We propose manufacturing methods and new processes while seeking to work at the least cost.

The trend currently is to integrate components, mix materials and replace some of the ceramic components (mostly for cost and flexibility reasons) by technologies used in printed circuits.
