

Christian Roux, Sales Manager, Axon'Cable

Currently there are few major international trade shows in France. The Component Show focuses more on consumer goods (washers, Xmas tree lights). The only general trade show in the field of electronics is Electronica in Munich. We indeed participate in many international trade shows abroad and are rather disappointed by the few offers of this type in France.

Axon'Cable designs and manufactures cables and electronic links for advanced technologies for the aerospace, IT, telecommunications, military electronics, steel, medical electronics, automotive and consumer electronic industries. ...

Our R&D teams includes engineers specialized in highly advanced technologies such as surface treatment, plastics processing, ultra high frequency, electromagnetism, micro-mechanics, high speed networks, etc. This is why 10% of the turnover is reinvested in R&D.

Exhibiting at the trade show RF&Hyper allows us to be present in Paris to meet customers and prospective clients who are interested in our products in the military, aeronautic, telecommunications industries; however, visitors are increasingly being discreet. During this exhibition we will present our ultra high frequency products but also our WiFi products, networks, and other products.

Our product range has not been completely changed; nevertheless, we continue to propose innovative solutions. On the one hand, we have developed hyper contacts up to 6 GHz for our Micro-D connectors, and on the other, we were able to make an experimental flexible cable up to 100 GHz for a Japanese client. Our Research & Innovation teams have in fact improved the mechanical performances of Celloflon to make it more crush-resistant.
